

The SonicWALL Network Security Appliance Series

NETWORK SECURITY

Next Generation Unified Threat Management Protection

- SonicWALL's next generation security
- Scalable multi-core hardware and Reassembly-free Deep Packet Inspection™
- Stateful high availability and load balancing features
- High performance and lowered TCO
- Advanced routing services and networking features
- Standards-based Voice over IP (VoIP)
- Secure distributed wireless LAN services
- Onboard Quality of Service (QoS)

Organizations of all sizes depend on their networks to access internal and external mission-critical applications. As advances in networking continue to provide tremendous benefit to organizations, they are increasingly challenged by sophisticated and financially-motivated attacks designed to disrupt communication, degrade performance and compromise data.

Malicious attacks penetrate outdated stateful packet inspection firewalls by exploiting higher network levels. Point products add layers of security, but are costly, difficult to manage, limited in controlling network misuse and ineffective against the latest multipronged attacks. The SonicWALL® Network Security Appliance (NSA) Series revolutionizes network security, utilizing a breakthrough multi-core design and patented Reassembly-free Deep Packet Inspection™ (RFDPI) technology* offering complete protection without compromising network performance. This platform was first made available on the SonicWALL E-Class NSA Series, and it is now available for mid-sized organizations.

The NSA Series overcomes the limitations of existing security solutions by scanning the entirety of each packet for current internal and external threats in real time. Built on a high-speed multi-core processing platform, the NSA Series enables deep packet inspection without adversely impacting the performance of mission-critical networks and applications.

The NSA Series applies next-generation Unified Threat Management (UTM) against a comprehensive array of attacks, combining intrusion prevention, anti-virus and anti-spyware with the application-level control of SonicWALL Application Firewall. With advanced routing, stateful high-availability and high-speed IPSec and SSL VPN technology, the NSA Series adds security, reliability, functionality and productivity to branch offices, central sites and distributed mid-enterprise networks, while minimizing cost and complexity.

Comprised of the **SonicWALL NSA 240, 2400, NSA 3500 and NSA 4500**, the NSA Series offers a scalable range of solutions designed to meet the network security needs of any organization.

Features and Benefits

SonicWALL's next generation security incorporates a new level of UTM that integrates intrusion prevention, gateway anti-virus and anti-spyware and features the Application Firewall suite of configurable tools to prevent data leakage and offer granular application control.

Scalable multi-core hardware and Reassembly-free Deep Packet Inspection™ scans and eliminates threats of unlimited file sizes, and provides virtually unrestricted concurrent connections with uncompromising speed. The NSA 240 Series can be configured using primary or secondary modem or 3G wireless interfaces for future-proofed extensibility.

Stateful high availability and load balancing features

in SonicOS 5.0 Enhanced maximize total network bandwidth and maintain seamless network uptime, delivering uninterrupted access to mission-critical resources, and ensuring that VPN tunnels and other network traffic will not be interrupted in the event of a failover.

High performance and lowered TCO are achieved by using the processing power of multiple cores in unison to dramatically increase throughput and provide simultaneous inspection capabilities, while lowering power consumption.

Advanced routing services and networking features

incorporate advanced networking and security technology including 802.1q VLANs, WAN/WAN failover, zone and object-based management, load balancing, advanced NAT modes and more, providing granular configuration flexibility and comprehensive protection at the administrator's discretion.

Standards-based Voice over IP (VoIP) capabilities provide the highest levels of security for every element of the VoIP infrastructure, from communications equipment to VoIP-ready devices such as SIP Proxies, H.323 Gatekeepers and Call Servers

Secure distributed wireless LAN services enable the appliance to function as a secure wireless switch and controller that automatically detects and configures SonicPoints,™ SonicWALL wireless access points, for secure remote access in distributed network environments.

Onboard Quality of Service (QoS) features use industry standard 802.1p and Differentiated Services Code Points (DSCP) Class of Service (CoS) designators to provide powerful and flexible bandwidth management that is vital for VoIP, multimedia content and business-critical applications.

Dynamic Security Architecture and Management

Best-in-Class Threat Protection

- SonicWALL deep packet inspection protects against network risks such as viruses, worms, Trojans, spyware, phishing attacks, emerging threats and Internet misuse. Application Firewall adds highly-configurable controls to prevent data leakage and manage bandwidth at the application level.
- 2 The SonicWALL Reaseembly-free Deep Packet Inspection™ (RFDPI) technology utilizes SonicWALL's multi-core architecture to scan packets in real-time without stalling traffic in memory.
- This functionality allows threats to be identified and eliminated over unlimited file sizes and unrestricted concurrent connections, without interruption.
- The Network Security Appliance Series provides dynamic network protection through continuous, automated security updates, protecting against emerging and evolving threats, without requiring any administrator intervention.

Unified Threat Management Load Balancing

Single processor designs that include multiple protection technologies are severely limited by a single centralized processor. SonicWALL UTM load balancing integrates a high-speed deep packet inspection and traffic classification engine onto multiple security cores inspecting applications, files and content-based traffic in real time without significantly impacting performance or scalability. This enables the scanning and control of threats for networks that carry bandwidth intensive and latency sensitive applications.

SonicWALL Clean VPN

The Network Security Appliance Series includes innovative SonicWALL Clean VPN™ technology which decontaminates vulnerabilities and malicious code from remote mobile users and branch offices traffic before it enters the corporate network, and without user intervention.

Centralized Policy Management

The Network Security Appliance Series can be managed using the SonicWALL Global Management System (GMS), which provides flexible, powerful and intuitive tools to centrally manage configurations, view real-time monitoring metrics and integrate policy and compliance reporting.

Flexible, Customizable Deployment Options – NSA Series At-A-Glance

Every SonicWALL Network Security Appliance solution delivers next generation Unified Threat Management protection, utilizing a breakthrough multi-core hardware design and Reassembly-free Deep Packet Inspection™ for internal and external network protection without compromising network performance. Each NSA Series product combines high-speed intrusion prevention, file and content inspection, and powerful Application Firewall controls with an extensive array of advanced networking and flexible configuration features. The NSA Series offers an accessible, affordable platform that is easy to deploy and manage in a wide variety of corporate, branch office and distributed network environments.

- The SonicWALL **NSA 4500** is ideal for corporate central-site and large distributed environments requiring high throughput capacity and performance
- The SonicWALL **NSA 3500** is ideal for corporate, branch office and distributed environments needing significant throughput capacity and performance
- The SonicWALL NSA 2400 is ideal for small-to-midsize corporate and branch office environments concerned about throughput capacity and performance
- The SonicWALL **NSA 240** is ideal for small-to-midsize businesses and branch office sites.

Security Services and Upgrades

Gateway Anti-Virus, Anti-Spyware, Intrusion Prevention Service and Application Firewall delivers intelligent, real-time network security protection against sophisticated application layer and content-based attacks including viruses, spyware, worms, Trojans and software vulnerabilities such as buffer

overflows. Application Firewall delivers a suite of configurable tools designed to prevent data leakage while providing granular application-level controls.

Enforced Client and Server Anti-Virus and Anti-Spyware

delivers comprehensive virus and spyware protection for laptops, desktops and servers using a single integrated client and offers automated network-wide enforcement of anti-virus and anti-spyware policies, definitions and software updates.

Content Filtering Service enforces protection and productivity policies by employing an innovative rating architecture, utilizing a dynamic database to block up to 56 categories of objectionable Web content.

ViewPoint Reporting delivers easy-to-use, Web-based capabilities that provide administrators with instant comprehensive insight into network performance and security. Delivered through a series of historical reports using dashboards and detailed summaries, ViewPoint helps organizations of all sizes track

Internet usage, fulfill regulatory compliance requirements and monitor the security status of their network.

Dynamic Support Services are available 8x5 or 24x7 depending on customer needs. Features include world-class technical support, crucial firmware updates and upgrades, access to extensive electronic tools and timely hardware replacement to help organizations get the greatest return on their

SonicWALL investment.

scale as the organization grows.

Global VPN Client Upgrades utilize a software client that is installed on Windows-based computers and increase workforce productivity by providing secure access to email, files, intranets, and applications for remote users. Upgrade licenses are available in a variety of user counts allowing this solution to

SSL VPN Remote Access Upgrades provide clientless remote network level access for PC, Mac and Linux-based systems. With integrated SSL VPN technology, SonicWALL UTM appliances enable seamless and secure remote access to email, files, intranets, and applications from a variety of client platforms

via NetExtender, a lightweight client that is pushed onto the user's machine. NetExtender is installed and configured automatically, requiring no user interaction.

New SonicWALL Comprehensive Anti-Spam Service blocks spam phishing and virus-laden emails at the gateway. There is no need to redirect an MX Record or send email to another vendor, with one click the service is activated and immediately starts blocking junk email and saving valuable network bandwidth.

¹ Testing Methodologies: Maximum performance based on RFC 2544 (for firewall). Actual performance may vary depending on network conditions and activated services. VPN throughput UDP traffic at 1418 byte packet size adhering to RFC 2544. UTM performance is based on HTTP tests run on the Spirent Avalanche/Reflector. Testing done with multiple flows through multiple port pairs.

² Only with the NSA 240 Series Stateful HA and Expansion Upgrade.

³ Actual maximum connection counts are lower when UTM services are enabled.
